### LISTING OF THE CLAIMS

1. (Previously Presented) A method for monitoring communications usage, comprising:  
  
receiving a call directed to a virtual telephone number in a service-providing network, the call originating from a native transport network having limited capability of providing advanced telephony service, the virtual telephone number associated with a dialed telephone number in the native transport network, the service-providing network providing intelligent services to said call, wherein the virtual telephone number utilizes the intelligent services provided by the service-providing network;  
  
routing said call to the separate native transport network for termination; and  
  
monitoring a duration of said call traversing the service-providing network.
2. (Previously Presented) The method of claim 1, further comprising monitoring a status of said call.
3. (Previously Presented) The method of claim 1, further comprising routing said call to an original destination via the separate native transport network.
4. (Canceled)
5. (Original) The method of claim 1, wherein said service-providing network is a network selected from the group consisting of a wireline network, a wireless network, and a packet-switching network.
6. (Previously Presented) The method of claim 1, further comprising associating the virtual telephone number to a wireless telephone number existing in the native transport network.
7. (Previously Presented) The method of claim 1, further comprising associating the virtual telephone number to another telephone number existing in the native transport network.

8. (Original) The method of claim 1, wherein said native transport network is a network selected from the group consisting of a wireline network, a wireless network, and a packet-switching network.
9. (Original) The method of claim 1, further comprising billing a telecommunications provider of said native transport network for said monitoring.
10. (Original) The method of claim 1, further comprising billing a subscriber based on said duration of said call.
11. (Previously Presented) A system for monitoring communications usage, the system operative to:

receive a call directed to a virtual telephone number in a service-providing network, the call originating from a native transport network having limited capability of providing advanced telephony service, the virtual telephone number associated with a dialed telephone number in the native transport network, the service-providing network providing intelligent services to said call, wherein the virtual telephone number utilizes the intelligent services provided by the service-providing network;

route said call to the separate native transport network for termination; and  
monitor a duration of said call traversing the service-providing network.

12. (Previously Presented) The system of claim 11, further operative to monitor a status of the call.
13. (Previously Presented) The system of claim 11, further operative to route said call to an original destination via the separate native transport network.

14. (Previously Presented) The system of claim 11, further operative to associate the virtual telephone number to another telephone number existing in the native transport network.
15. (Previously Presented) The system of claim 11, further operative to associate the virtual telephone number to a packet voice-based telephone number existing in the native transport network.
16. (Original) The system of claim 11, wherein said service-providing network comprises an Advanced Intelligent Network (AIN).
17. (Original) The system of claim 11, wherein said service-providing network comprises a packet-switching network.
18. (Previously Presented) The system of claim 11, wherein the service-providing network modifies messages accompanying the call so that the call is not routed back to the service-providing network in an endless loop.
19. (Previously Presented) The system of claim 11, wherein the service-providing network modifies caller information associated with the call.
20. (New) A computer program product comprising processor-executable instructions for performing a method, the method comprising:

receiving a call directed to a virtual telephone number in a service-providing network, the call originating from a native transport network having limited capability of providing advanced telephony service, the virtual telephone number associated with a dialed telephone number in the native transport network, the service-providing network providing intelligent services to said call, wherein the virtual telephone number utilizes the intelligent services provided by the service-providing network;

routing said call to the separate native transport network for termination; and

monitoring a duration of said call traversing the service-providing network.
